

ABSTRACT

5 Process for control and management of an Intranet network by means of a
Web browser, comprising the steps of:

- discovering the devices of an Intranet network, including the different subnets;
- extracting data representative of those devices for the purpose of compiling a file
10 which is transmitted through a HTTP protocol to a Web server associated to a
database;
- deploying a Internet Control Agent in the devices contained within said Intranet,
said agent being controllable from the said Web server by a set of commands being
exchanged with the HTTP or HTTPS protocol;
- 15 - regularly transmitting set of instructions to said agents for the purpose of
controlling tasks to be performed within the network.

Preferably, the set of instructions is used for controlling a remote installation of a
software package within the devices in accordance with selections made by the IT
administrator.
